

International Trade

The Plan

- ▶ Logic of trade
- ▶ Develop Ricardian model of trade. Today. . .
 - Opportunity cost and production possibilities.
 - No trade equilibrium.

The Logic of Trade

- ▶ Voluntary exchange is “win-win”
 - Suppose two people or firms value a product or asset differently
 - Trade can benefit both
- ▶ Example in labor markets:
 - You value your time at 50 an hour
 - A firm values your time at 60 an hour
 - At what price does trade take place?
 - Who wins?

The Logic of Trade

- ▶ Voluntary exchange is “win-win”
 - Suppose two people or firms value a product or asset differently
 - Trade can benefit both
- ▶ Example in reality:
 - Green Bay Packers, Summer 08, 2 good quarterbacks
 - NY Jets, none
 - Solution: trade!

The Logic of Trade

- ▶ Voluntary exchange is “win-win”
 - Suppose two people or firms value a product or asset differently
 - Trade can benefit both
- ▶ The price often depends on who has the most bargaining power. Consider this game
 - We have 100 dollars. Make me an offer on how to split 100 dollars.
 - If I agree, we get to keep it. If not 100 dollars is destroyed.
 - What offers would money not be destroyed?
 - What is the “Nash equilibrium” outcome?

International Trade—Economics of Global Business, Revised: March 25, 2019

Reasons for International Trade

- ▶ Relative costs of production, i.e. **comparative advantage**, rationalize international trade patterns.
- ▶ What shapes a country's comparative advantage...
 - Technology, productivity of workers (absolute advantage).
 - proximity,
 - resources.

International Trade—Economics of Global Business, Revised: March 25, 2019

Ricardo's Model of Trade

- ▶ David Ricardo, 1817
 - Two goods, countries have fixed productivity at producing them
 - In free trade: each country produces one good
- ▶ Key concept—comparative advantage
 - Each country should produce the good at which it is **comparatively** the most productive.

International Trade—Economics of Global Business, Revised: March 25, 2019

Ricardo's Model

- ▶ Two countries (Home, Foreign), two goods (cloth, wheat), one input (labor)
- ▶ Labor is mobile across sectors.
- ▶ Constant marginal products of labor (MPL):

	Cloth	Wheat	Labor
Home	2	4	25
Foreign	1	1	100

International Trade—Economics of Global Business, Revised: March 25, 2019

Opportunity Cost

► Opportunity cost: What you forgo when making a choice

- This context, cloth you give up to make one more unit of wheat

► For the Home

- 1 wheat takes $1/4$ units of labor
- $1/4$ units of labor could make $1/4 \times 2 = 1/2$ cloth
- Opportunity cost of 1 wheat is $1/2$ cloth

	Cloth	Wheat	Labor
Home	2	4	25
Foreign	1	1	100

International Trade—Economics of Global Business, Revised: March 25, 2019

PPF and Opportunity Cost

International Trade—Economics of Global Business, Revised: March 25, 2019

Relative Prices

► Recall from Chapter 3 Mankiw, profit maximization implies

$$P \times MPL = W$$

► In the Ricardian model, workers are free to move and work in the sector paying the highest wages.

► Thus wages in Cloth sector must equal wages in Wheat sector.

$$P_W \times MPL_W = W = P_C \times MPL_C$$

$$\frac{P_W}{P_C} = \frac{MPL_C}{MPL_W} = \frac{2}{4}$$

► The relative price of wheat = the opportunity cost of wheat!

International Trade—Economics of Global Business, Revised: March 25, 2019

Equilibrium: Marginal Cost = Marginal Benefit

International Trade—Economics of Global Business, Revised: March 25, 2019

Do at home. . .

- ▶ What is the Foreign country's opportunity cost of producing wheat?
- ▶ What is the Foreign country's opportunity cost of producing cloth?
- ▶ What is the autarky relative price of wheat?

Where we are going next. . .

- ▶ Pattern of trade.
- ▶ Prices at which countries are willing to trade internationally.
- ▶ Gains from trade.
